1 Documentation

1.1 A brief description

01	02	03
04	05	06
07	08	09
10	11	12

Tiled graphic (4×3)

The document author opens the create-tg.tex file and specifies three arguments of the $\texttt{\sc tTileParams}$ command: a number n that corresponds to the number of rows; a number m that represents the number of columns; and the path to a graphic. Compiling create-tg.tex, when the option wrttofiles is specified, results in the specified graphic being broken down into a series of $n \times m$ tiled graphics. The order of the creation of the tiles is top to bottom, left to right: The first row is the top most row, and the graphic is tiled across the row, from left to right, the next row, is the one just below the top row, and the graphic is tiled

across that row, from left to right, and so on. Refer to the crude diagram to the left.

Warning: This package uses the shellesc package, which requires the --shell-escape switch. Use this package only if you trust the author of this package.

1.2 Applications

The tile-graphic package can be used to produce tiled graphics, which can be consumed by the dps and acrosort packages.

1.3 The create-tg.tex file

Because of the extensive use of \ShellEscape, create-tg.tex is similar to a BAT (batch) file. When you compile create-tg.tex, one result is create-tg.pdf; create-tg.pdf is a one page summary titled **Tile Graphic Report**. In addition to producing a report, there is the actual result the report refers to: the production of tiled graphic files (PDFs).

Tiled graphics are obtained by compiling create-tg.tex, after setting three parameters; using this package, therefore, is very simple. Below is the verbatim listing of the create-tg.tex, found in the examples folder.

\documentclass{article}

- (2) $\ensuremath{\mbox{\mbox{$\setminus$}}}{\langle nRows\rangle}}{\langle nCols\rangle}{\langle path\rangle}$ \begin{document}
- (3) \tileTheGraphic \end\darg{document}

When create-tg.tex is compiled, the DVI (in the case of IATEX) or the PDF (in all other cases) produces a single page document the title of which is "Tile Graphic Report." The file also produces, depending on the options used, various separate PDFs consisting of tiled graphics.

Discussion. We discuss each of the numbered lines slightly out of order.

\setTileParams

- (2) $\sl [\langle ig-opts \rangle] {\langle nRows \rangle} {\langle nCols \rangle} {\langle path \rangle}$ The command and its arguments are placed in the preamble.
 - (ig-opts) This optional argument is passed to the underlying optional argument of the \includegraphics command. Normally, there is no optional options passed.
 - (nRows) This argument declares the number of rows you want to break the graphic into.
 - ⟨nCols⟩ This argument declares the number of columns you want to break the graphic into.

⟨path⟩ The path to the graphic. The graphic is any file format supported by the PDF creator. For a latex->dvips->⟨ps2pdf|distiller⟩ workflow, the graphic should be an EPS file; in all other workflows, the graphic can be a PDF (or some other supported graphical format). For example, if the graphic is in the graphics folder of the source file, then ⟨path⟩ might read graphics/mygraphic, where mygraphic.pdf (for example) is in the graphics folder.

With no package options, compiling create-tg.tex produces a document a single page document with a message, seen in Figure 1.

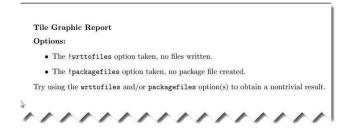

Figure 1: No options

\usepackage [\langle options \rangle] {tile-graphic}
 For the package declaration, the \langle options \rangle are described below.

wrttofiles When create-tg.tex is compiled with the wrttofiles option only and with a $\langle path \rangle$ argument of graphics/mygraphic, $\langle nRows \rangle \times \langle nCols \rangle$ individual tile PDF files named

mygraphic_01.pdf, mygraphic_02.pdf, ...

are created and placed in the graphics folder. If no subfolder is specified, files are placed in the source file's folder. The source file that is compiled (create-tg.pdf) contains the Tile Graphic Report.

!wrttofiles (Convenience option) This option reverts to the default, no separate tile PDFs are produced.

packagefiles When this option is specified, $\langle nRows \rangle \times \langle nCols \rangle$ pages are produced and "packaged" in a separate PDF document named $\langle basename \rangle$ -package.pdf, where $\langle basename \rangle$ is the base name of the graphic. See the crude illustration to the left.

!packagefiles (Convenience option) Reverses the packagefiles option, as a result, no package file is created.

pdfcreator=\(pdflatex|lualatex|xelatex|ps2pdf|distiller\)

When the option wrttofiles or packagefiles is specified, compiling create-tg.tex produces one or more PDF files. These PDFs are produced by pdflatex, lualatex, xelatex, ps2pdf, or distiller by executing a series of \ShellEscape commands. The PDF creator application

01

02

03

04

06

:::

10

11

12

Pages (4×3)

used is determined by the value of the pdfcreator key. The default is pdflatex.

Using the \ShellEscape command is system dependent. The tilegraphic package is set up for the Windows OS; it uses del, copy, and move. Refer to Section 2.4 for more information for modifying these system commands.

tile-graphic also uses \ShellEscape to compile certain dynamically created TEX files. There are hooks to modify the compile commands that can be used at your discretion. Again, refer to Section 2.4 for more information.

\tileTheGraphic

(3) \tileTheGraphic is placed in the body of the document. It is this command that does all the work, based on the parameters of \setTileParam.

Required packages. The following package are required: shellesc, web, graphicx, and multido.

Try it, you'll like it. The first thing to do, once the package is installed, is to try the compiling the file create-tg.tex. There are three graphics files, one at the top level of the examples folder, one in the choo subfilder, and one in the postscript subfolder. Try both graphics (only one graphic at a time, however). Try all possible combinations of the basic options wrttofiles, !wrttofiles, packagefiles, and !packagefiles; you can even try the various values of pdfcreator.

Description of the workflow

Be aware that there are two instances, or stages, of compiling:

\setTileParams

\setTileParams

- Stage 1. Compiling create-tg.tex, usually, this is initiated in some LATEX editor. At this stage, you can compile with latex.exe, pdflatex.exe, lualatex.exe, or xelatex.exe. When \setTileParams is expanded, it reads the graphic file, (path), using \includegraphics to determine its size. Therefore, the graphic must be one that is supported by the pdf creator at this point. For example if the graphic is a PDF, yet you use latex.exe to compile create-tg.tex, you get an error because latex.exe does not support PDF inclusion.
- Stage 2. Compiling of one or more files to produce tiled graphics, this step is initiated by the \ShellEscape command. The application used to compile at this stage is determined by the pdfcreator key. When the packagefiles option is taken, the \setTileParams is expanded again and the graphic file, (path), is included to determine dimension of the graphic. Again, the graphic must be a format supported by the PDF creator as selected by the pdfcreator key, which may be different from the compiler of the first case above.

Additional thoughts on the workflow.

• pdfcreator=\pdflatex|lualatex|xelatex\

This is the easiest and simplest case. Usually the PDF creators for the two stages of compiling are the same (refer to Stages 1 and 2, above). These are direct-to-PDF applications, the workflow is relatively quick, smooth, and automated. All AUX files are are deleted except for the AUX files of the main file create-tg.tex.

• pdfcreator=\(\rangle ps2pdf | distiller \rangle

The graphic file format must be EPS for Stage 2; however, if you are not using latex.exe in Stage 1, the graphic must be one that is supported by the PDF creator used. Thus you may have two copies of the graphic of different formats. You're not going to do that, are you? Usually the PDF creators for the two stages of compiling are the same, that way you need not have two formats for the graphic.

```
    pdfcreator=\(\ps2\pdf\)
    The workflow is latex->dvips->ps2pdf
```

- pdfcreator=\distiller\)

The workflow is latex->dvips->distiller. There is a difference between using distiller and ps2pdf, in the latter case, the PS file can be a relative path; in the former case, it must be a full (or absolute) path, this is a slight complication. For this bad boy, we provide the \fullPathToSource, refer to Section 2.4 for more details.

\fullPathToSource

1.5 The Configuration File

tg.cfg A configuration file, named tg.cfg, is input at the end of the package. You might make any customizations there, where you customize for the pdf creator you always use, or, if you use several, you can make customizations for each by using the \ifcase structure below.

```
\ifcase\tg@case\relax
  \def\tg@pdfcreator@app{pdflatex}
  \or
  \def\tg@pdfcreator@app{lualatex}
    \customizations-for-lualatex}
  \or
  \def\tg@pdfcreator@app{xelatex}
    \customizations-for-xelatex}
  \or
  \def\tg@pdfcreator@app{ps2pdf}
    \customizations-for-ps2pdf}
  \or
  \def\tg@pdfcreator@app{acrodist}
```

tg.cfg.txt See the file tg.cfg.txt for this structure. Rename it to tg.cfg if found to be useful.

End of Documentation———

2 The package code

Having finished the barest of documentation, we begin the markup of this package.

2.1 Options

We bring in the xkeyval package so we can gather our options using it's commands, rather than the default keyval commands.

2 \RequirePackage{xkeyval}

wrttofiles
!wrttofiles

When wrttofiles is specified, $\langle nRows \rangle \times \langle nCols \rangle$ PDF files are created. When !wrttofiles is used, these files just mentions are not created.

- 3 \newif\if@wrttofiles\@wrttofilesfalse
- 4 \DeclareOptionX{wrttofiles}{\@wrttofilestrue}
- 5 \DeclareOptionX{!wrttofiles}{\@wrttofilesfalse}

packagefiles
!packagefiles

When specified, a single "package" PDF is created containing $\langle nRos \rangle \times \langle nCols \rangle$ pages of tiled graphics Likewise, the option !packagefiles reverses packagefiles to return to the default state, files are not packaged.

- 6 \newif\if@packagefiles \@packagefilestrue
- 7 \DeclareOptionX{packagefiles}{\@packagefilestrue}
- 8 \DeclareOptionX{!packagefiles}{\@packagefilesfalse}

 ${\tt pdfcreator=} \langle {\tt pdflatex|lualatex|xelatex|ps2pdf|distiller} \rangle$

- 9 \define@choicekey*+{tile-graphic.sty}{pdfcreator}[\val\nr]%
- 10 {pdflatex,lualatex,xelatex,ps2pdf,distiller}{%
- 11 \edef\tg@case{\nr}%
- 12 \ifcase\nr\relax
- 13 \def\tg@pdfcreator@app{pdflatex}\or
- 14 \def\tg@pdfcreator@app{lualatex}\or
- ${\tt 15} \qquad {\tt \def\tg@pdfcreator@app\{xelatex\}\backslash or}$
- 16 \def\tg@pdfcreator@app{ps2pdf}\or
- 17 \def\tg@pdfcreator@app{acrodist}\fi
- 18 }{\PackageWarning{tile-graphics}%
- 19 {Bad choice for pdfcreator, permissible values\MessageBreak
- 20 are pdflatex, lualatex, xelatex, ps2pdf, and\MessageBreak
- 21 distiller.\MessageBreak Using the default pdflatex}}
- 22 \def\tg@pdfcreator@app{pdflatex}\def\tg@case{0}

Process the options

```
23 \ProcessOptionsX\relax
24 \edef\tg@restoreCats{%
    \catcode'\noexpand\"=\the\catcode'\"\relax
    \catcode'\noexpand\,=\the\catcode'\,\relax
27
    \catcode'\noexpand\_=\the\catcode'\_\relax
28 }
29 \@makeother\"\@makeother\,\@makeother\_
```

2.2Required Packages

The web package is use to set the page dimensions, it also brings in hyperref. We use graphicx package to have access to \includegraphics. The \multido package is used to work across the face of the graphic by row, top to bottom, to clip off little bounding boxes of the graphic. shellesc is required for the wrttofiles option.

```
30 \RequirePackage{shellesc}
31 \RequirePackage{web}
32 \RequirePackage{graphicx}
33 \RequirePackage{multido}
```

2.3 Registers and other preliminaries

\if@wrtorpkg

We declare a new if, \if@wrtorpkg, which is true if either \if@wrttofiles or \if@packagefiles is true. This is a convenience to the coding.

```
34 \newif\if@wrtorpkg \@wrtorpkgfalse
35 \if@wrttofiles
36 \@wrtorpkgtrue
37 \else
38
    \if@packagefiles
39
      \@wrtorpkgtrue
40
  \fi
41 \fi
42 \newif\iftg@direct \tg@directtrue
43 \newif\iftgfolder \tgfolderfalse
\iftg@direct is false if pdfcreator=\ps2pdf/distiller\.
```

\iftg@direct

44 \ifnum\tg@case>\tw@\relax\tg@directfalse\fi

A few comments on the \ifpassthruTG switch. This package performs some tricks. Initially, \ifpassthruTG is true, and certain portions of the code are executed. When create-tg.tex is compiled with \passthruTGtrue, it writes to the current folder the file package-data.cut containing the single command \passthruTGfalse. During this compile, create-tg.tex makes a copy of itself named \(\lambda \text{basename} \)\text{-package.tex.} It is this tile that is compiled by \ShellEscape, and when compiled, reads package-data.cut, since it now exists, and \ifpassthruTG is set to false, at which point a different set of code lines are executed.

45 \newif\ifpassthruTG \passthruTGtrue

Some miscellaneous lengths, boxes, and utility commands.

```
46 \newdimen\tg@dima
```

- 47 \newdimen\tg@dimb
- 48 \newbox\tg@box
- 49 \newcount\tg@Cnt
- 50 \def\tg@rmslash#1/{\def\tgInFolder{#1}}%
- 51 \let\tgInFolder\@empty

2.4 Some customization commands

\sysdel \syscopy \sysmove System commands. These are \sysdel, \syscopy, and \sysmove. The default is to use Windows OS commands. Changes for UNIX/Linux or MacOS are easy enough by declaring these three commands in the preamble (or in tg.cfg), their arguments are the names of the corresponding system commands for deleting, copying, and moving files.

```
52 \def\sysdel#1{\def\tg@sysdel{#1\space}}
53 \sysdel{del}
54 \def\syscopy#1{\def\tg@syscopy{#1\space}}
55 \syscopy{copy}
56 \def\sysmove#1{\def\tg@sysmove{#1\space}}
57 \sysmove{move}
```

Changing the switches in Stage 2. Here is a link to the Stage 2 reference. There are two TEX files compiled: (1) the package file, and (2) the individual tiles graphic files. We provide a hook to modify the command line switches of the pdfcreator. \pkgappArgs is the hook into the creation of the package file. Use #1 to represent the pdfcreator application. For example, \pkappArgs{#1 -halt-on-error} produces a command line of

```
pdflatex -halt-on-error -shell-escape \( \targeted - package - file.tex \)
```

For a pdfcreator of pdflatex. The --shell-escape is automatically included.

```
58 \def\pkgappArgs#1{\def\pkg@ppArgs##1{#1}} 59 \pkgappArgs{#1}
```

\tileappArgs

\pkgappArgs

We also separately compile each of the separate tile graphics. \tileappArgs is similar to \pkgappArgs. If we declare \tileappArgs{#1 -halt-on-error}, then the command line becomes,

```
pdflatex -halt-on-error \( \targeted - tile - graphic.tex \)
```

Here, --shell-escape is not automatically included as it is not needed for this step.

```
60 \def\tileappArgs#1{\def\tile@ppArgs##1{#1}} 61 \tileappArgs{#1}
```

Some unverified tricks. What if your system does not recognize pdflatex, lualatex, and so on; perhaps they are know by different names. You can use these hooks to fix that. For example,

```
\pkgappArgs{\langle alt-pdflatex \rangle .exe \langle other-switches \rangle \}
```

Or, perhaps the path to this application is not on the system paths, hence pdflatex is not recognized, in this case, try

```
\property \pro
```

that "should" work.

\latexappArgs \dvipsappArgs When pdfcreator=\langle ps2pdf | distiller \rangle, we provide two hooks for this workflow: \langle latexappArgs and \dvipsappArgs. These function similar to the ones described above; for example, \dvipsappArgs{#1 -q*} passes the -q* switch (quiet mode) to dvips. No separate commands for a package compile versus a tile compile, as seen above, are defined, though that could change.

- 62 \def\latexappArgs#1{\def\latex@ppArgs##1{#1}}
- 63 \latexappArgs{#1}
- 64 \def\dvipsappArgs#1{\def\dvips@ppArgs##1{#1}}
- 65 \dvipsappArgs{#1}

 $\definePath{\langle \definePath}{\langle \defining \defining \defining \define}$ A command taken from eforms that normalizes the argument before defining $\definePath{\langle \definePath \definePath \define}$

- 66 \providecommand{\definePath}[1]{\def\ef@ctrlName{#1}%
- 67 \hyper@normalise\ef@definePath}
- 68 \def\ef@definePath#1{\expandafter\xdef\ef@ctrlName{#1}}

Support for pdfcreator=distiller.

\fullPathToSource{\langle path\rangle} Set the full path to the source file (create-tg.tex). This command is only needed when pdfcreator=distiller.

- 69 \def\fullPathToSource{\definePath{\tg@fullPathToSource}}
- 70 \let\tg@fullPathToSource\@empty

After creation hooks. We provide additional hooks, the first is placed just after a tile file is created, and second one is placed just after the package file is created.

\afterTileCreationHook{\\cmds\} The \\cmds\\ can be any valid LATEX commands, conceptually, the commands may contain \ShellEscape commands. The hook is placed just after a tile file is created as a PDF.

 $\afterPkgCreationHook{\langle \cmds \rangle}$ Similar to \afterTileCreationHook , but for the creation of the tile package.

- 71 \def\afterTileCreationHook#1{\def\@fterTileCreationHook{#1}}
- 72 \let\@fterTileCreationHook\relax

The definition of \afterPkgCreationHook.

- 73 \def\afterPkgCreationHook#1{\def\@fterPkgCreationHook{#1}}
- 74 \let\@fterPkgCreationHook\relax

Examples. This example makes each tile PDF file into a tile EPS file. We use the utility executable pdftops, which may be available on your TEX system. In the preamble or above the \tileTheGraphic command, place the following commands.

```
\afterTileCreationHook{%
  \ShellEscape{pdftops -eps tile-template.pdf
    tile-template.eps}%
  \ShellEscape{copy tile-template.eps \tgTileBaseIndx.eps}%
  \iftgfolder
    \ShellEscape{move \tgTileBaseIndx.eps \tgInFolder}%
  \fi
}
\afterPkgCreationHook{%
  \typeout{!! Package creation: \tgBaseName_package.pdf !!}}
```

Commentary. At insertion point of the hooks in the code stream, the tile file is named tile-template. The declared \afterTileCreationHook converts each tile file, to an EPS file of the same name. Then, it copies tile-temp.eps to \tgTileBaseIndx.eps. Next, we test whether this file came from a subfolder (using the switch \iftgfolder). Finally, if the file belongs in the folder, \iftgfolder \tgInFolder, we move it there. For the \afterPkgCreationHook, we do nothing other than to write some text to the terminal, we use the base name of the graphic

\tgBaseName

\tgInFolder

\tgTileBaseIndx

\tgBaseName.

 $\parbox{packagesuffix}(\parbox{name})$ The name used as suffix to the packaged tiled files. Originally, this was packaged, but I am changing it to package, to be in conformance with the acrosort package.

75 \newcommand{\packagesuffix}{package}

\setTileParams: A preamble command

 $\stileParams[\langle ig-opts \rangle] \{\langle nRows \rangle\} \{\langle nCols \rangle\} \{\langle path \rangle\}$ The parameters are described in Section 1 (Documentation).

76 \newcommand{\setTileParams}[4][]{%

We require the entries in #2 and #3 ($\langle nRows \rangle$ and $\langle nCols \rangle$) to be nonnegative natural numbers (1, 2, 3, ...), so we pass through a dimension register and into a count register, this should make what is entered a natural number. If not greater or equal to 1, we complain, and set to the number 2.

```

coodinates, \y1, \y2, \y3, \y4, from bottom to top.

This is the file that is compiled using \ShellEscape to create the individual tile files. This document contains a trick, the use of the tmp package, which is

written dynamically just before this file is compiled. The tmp package is created by \tg@wrttmppkg, defined next. The tmp package defines the command \tgInputContent in the body of the document.

```

             \edef\oY{\the\@tempcntb}%
```

We write the CUT files.

239 \wrtTileCuts

Include the graphic with the appropriate viewport and clip; however, we executed the temporary command \z if the option \packagefiles is in effect.

\wrtTileCuts

(Called by \tg@domultido) The CUT files created are the body content of the tile-template.tex file. The CUTs are also used by the package file routine. The content of these CUT files has the following form:

```
\parbox{132.23935pt}{\includegraphics[width=132.23935pt, viewport=0 114.23943 132.23935 228.47885,clip]{\( \nu \text{pathToPic} \)}}
```

where the values of width and viewport were calculated by the \setTileParams in the preamble.

```
248 \def\wrtTileCuts{%
249 \def\CommentCutFile{\tg@base_\x.cut}%
250 \immediate\openout\CommentStream=\CommentCutFile
```

```
251 \immediate\write\CommentStream{\string
252 \parbox{\tg@WD}{\string
253 \includegraphics[width=\tg@WD,%
254 viewport=\@nu{x\iC} \@nu{y\iR} \@nu{x\oX} \@nu{y\oY},%
255 clip]{\pathToPic}}\immediate\closeout\CommentStream
256}
```

\compileTileFiles

\@fterPkgCreationHook

(Called from \tileTheGraphic) This command performs the \ShellEscape steps. It is executed only if the wrttofiles or packagefiles option is taken (or both).

```
257 \def\compileTileFiles{%
258 \ifpassthruTG
259 \if@packagefiles
```

Package the tile files. This code is executed by create-tg.tex (because \passthruTG is true). We write the package-data.cut file, later input by the tmp package, which puts \passthruTG to false.

```
260 \def\CommentCutFile{package-data.cut}%

261 \immediate\openout\CommentStream \CommentCutFile

262 \immediate\write\CommentStream{\string\passthruTGfalse}%

263 \immediate\closeout\CommentStream
```

Then copy \create-tg.tex to \(\lambda basename \rangle \)_package.tex. Keep in mind that when we compile \tg@base_package.tex which uses the tile-graphic package, \passthruTG is false. When \(\lambda basename \rangle \)_package.tex gets here, this block of code is skipped over.

```
